

Installing MacBook Core Duo Hard Drive Connector

Tools used in this guide

- [Coin](#) (1)
- [Phillips #00 Screwdriver](#) (1)
- [Spudger](#) (1)

Parts relevant to this guide

- [MacBook Hard Drive Cable](#) (1)

How to remove the hard drive connector.

Step 1 - Battery

- Use a coin to rotate the battery-locking screw 90 degrees clockwise.

Step 2

- Lift the battery out of the computer.

Step 3 - Memory Cover

- Remove the three evenly-spaced Phillips screws from along the rear wall of the battery compartment.
- The screws are captive to the metal memory cover.

Step 4

- Lift up on L-shaped memory cover, slide it to the right, and lift it out of the computer.

Step 5 - Upper Case

- Remove the following 3 screws:
 - One 11 mm Phillips #00 in the middle of the case.
 - Two 14.5 mm Phillips #00.
- If the screws stick in the case, you can use a magnetized screwdriver to draw them out.
- The shorter of the three screws goes in the middle.

Step 6

- Remove the following 3 screws from the rear wall of the battery compartment:
 - Two 3 mm Phillips #000.
 - One 4 mm Phillips #000 on the right side.
- When reinstalling these screws, it may be helpful to push down on the lower case to line up the screw holes.

Step 7

- Remove the two Phillips #00 screws from either side of the right wall of the battery compartment (not the ones closest to the battery connector).

Step 8

- Remove the four indicated Phillips #00 screws from the front wall of the battery compartment. When working from the left, remove the 2nd, 4th, 7th and 9th screw.

Step 9

- Remove the following 4 screws from the back of the computer:
 - Two 7 mm Philips on the far sides.
 - Two 10.5 mm Phillips toward the center.

Step 10

- Remove the two Phillips #00 screws from the optical side of the computer.
- It is not necessary to remove the similar screws on the other side of the computer.

Step 11

- Starting near the display and working around to the front of the computer, pry up on the upper case. It is held with clips on the right above the optical drive. These will release with some firm lifting pressure.
- There's a trackpad and keyboard ribbon connecting the upper case to the logic board, so don't pull the upper case off entirely just yet.

Step 12

- While holding up the upper case, use a spudger to pry up the orange trackpad and keyboard cable from its connector.

Step 13 - Hard Drive Connector

- Use the white plastic pull-tab to slide the hard drive to the left and out of the computer.

Step 14

- Disconnect the orange optical drive ribbon cable from the logic board.

Step 15

- Disconnect the newly-revealed display data cable. If there is no pull-tab on the top of the connector, it may be helpful to use a spudger to disconnect this connector.

Step 16

- Disconnect the (once again) newly-revealed hard drive cable.

Step 17

- Deroute the hard drive connector cable from the four tabs along the edge of the optical drive.

Step 18

- Remove the two Phillips screws securing the hard drive connector to the lower case.

Step 19

- Carefully lift the hard drive connector out of the case slightly, and turn it over to reveal the IR sensor connector beneath. Use a spudger to flip up the tiny bar holding the cable in place.
- Slide the orange IR sensor cable out of its connector, and lift the hard drive connector out of the computer.

To reassemble your device, follow these instructions in reverse order.
